

PRODUCT UPDATE

NEW LNG IUS: GOOD FOR 5 YEARS

Kyleena™ (levonorgestrel-releasing intrauterine system; IUS) 19.5 mg, from **Bayer**, is a new hormonal contraceptive device used to prevent pregnancy for up to 5 years. The

small, flexible plastic, T-shaped long-acting reversible contraceptive can be distinguished from other IUSs by the combination of the visibility of the silver ring on ultrasound and the blue color of the removal threads, says **Bayer**. **Kyleena** is placed by a health care provider during an office visit. **Bayer** indicates that metrorrhagia or menorrhagia may occur during the first 3 to 6 months of use, and menstrual periods may become infrequent or cease.

EASIER LAPAROSCOPIC ACCESS

LapCap₂ is a sterile, single-use device with a molded plastic dome, a suction-system port, and a septum for Veress needle insertion from **Life Care Medical Devices** that is

designed to provide safe and rapid access for minimally invasive surgery. **Life Care** says single-operator access and abdominal stabilization are advantages of **LapCap₂**.

To use **LapCap₂**, says **Life Care**, center it over the umbilicus, attach a hose to the suction port, and apply negative pressure. The abdomen immediately rises for Veress needle insertion. Inert gas is then delivered to replace the negative pressure, and the procedure can continue.
