

Appendix Figure 2. Association of job function and work location with seropositivity among all tested healthcare workers residing in NYC. Panel A shows adjusted multivariable logistic regression odds ratios for seropositivity compared to administrative job function. Panel B shows adjusted multivariable logistic regression odds ratios for seropositivity compared to office work location. The vertical lines indicate 95% confidence intervals. This data is drawn from the group of 1,928 healthcare workers (HCWs) residing in NYC who were tested.
