PRODUCTS

Facial Peel for Sensitive Skin

ProCyte's Facial Peel Kit is derived from 30% lactic acid, making it an effective and suitable treatment for sensitive skin or first-time users. The kit is for professional use only and includes enough peel, prepping solution, and neutralizer for a single treatment. Three to five treatments are recommended for best results in reducing fine lines and wrinkles, hyperpigmentation, and large pores, and in enhancing sun-damaged skin, acne, and acne scars. The kit is available for dispensing physicians at www.procyte.com.

Hygienic Hand Foam

Avagard foam instant hand antiseptic with moisturizers contains 62% ethyl alcohol and has shown effectiveness against various organisms, including methicillin-resistant Staphylococcus aureus. The foam can be used with latex and nonlatex gloves, and the formula is free of fragrance, dye, latex, preservative, and paraben. For more information, contact 3M at http://solutions.3m.com.

Lice Light

The Nit Lite is a handheld lice detection device that combines a magnifying lens with a low-energy ultraviolet A light. The UVA light causes the nits to glow, which makes finding and removing them from hair shafts more efficient for parents, teachers, physicians, and other lice-screening volunteers. For more information, contact Rite Lite by visiting www.rite-liteinc.com.

Multiple Skin Test System

The ComforTen Skin Test device features 10 single surgical steel 1.2-mm lancet tips, which minimize skin trauma during allergy testing. ComforTen is the only 10-test, self-loading, surgical steel testing device on the market. Little to no trauma at the negative control site makes it easy to determine what allergens the patient reacts to. For more information, visit www.home. hollisterstier.com/allergy.

Skin Cleansing Product Line

The Excelladermisé line of products cleanses the skin and helps to smooth and restore it. These products are used daily in place of conventional cleansers. Enzopro Gentle Excellerator is an enzyme gel cleanser (retail cost \$38). Hydro-Derm Infusion is an analgesic botanical tonic that hydrates the skin (\$34). Hydro-Mist Emulsion combines aromatherapy with antioxidants (\$24). For more information, contact Esenté International LLC by visiting www.esente.com.

BRIEF SUMMARY

Revised: January 2006

Protopic°

Ointment 0.03% Ointment 0.1%

FOR DERMATOLOGIC USE ONLY
NOT FOR OPHTHALMIC USE
Rx Only
See boxed WARNING concerning long-term safety of topical calcineurin inhibitors

topical calcineurin inhibitors
INDICATIONS AND USAGE
PROTOPIC Ointment, both 0.03% and 0.1% for adults, and only 0.03% for children aged 2 to 15 years, is indicated as second-line therapy for the short-term and non-continuous chronic treatment of moderate to severe atopic dermatitis in non-immunocompromised adults and children who have tailed to respond adequately to other topical prescription treatments for atopic dermatitis, or when those treatments are not advisable.

PROTOPIC Ointment is not indicated for children younger than 2 years of age (see boxed WARNING, WARNINGS and PRECAUTIONS: Pediatric Use).

CONTRAINDICATIONS
PROTOPIC (tacrolimus) ointment is contraindicated in patients with a history of hypersensitivity to tacrolimus or any other component of the ointment.

WARNING

Long-term Safety of Topical Calcineurin Inhibitors Has Not Been Established

Although a causal relationship has not been established, rare cases of malignancy (e.g., skin and lymphoma) have been reported in patients treated with topical calcineurin inhibitors, including PROTOPIC Ointment.

Continuous long-term use of topical calcineurin inhibitors, including PROTOPIC Dintment, in any age group should be avoided, and application limited to areas of involvement with atopic dermatitis.

PROTOPIC Ointment is not indicated for use in children let than 2 years of age. Only 0.03% PROTOPIC Ointment indicated for use in children 2-15 years of age.

Prolonged systemic use of calcineurin inhibitors for sustained immunosuppression in animal studies and transplant patients following systemic administration has been associated with an

of immunosuppression.

Based on the information above and the mechanism of action, there is a concern about potential risk with the use of topical calcineurin inhibitors, including PROTOPIC Ointment. While a causal relationship has not been established, rare cases of skin malignancy and lymphoma have been reported in patients treated with topical calcineurin inhibitors, including PROTOPIC Ointment.

- PROTOPIC Ointment should not be used in immunocompromised adults and children.
- Il signs and symptoms of atopic dermatitis do not improve within 6 weeks, patients should be re-examined by their healthcare provider and their diagnosis be confirmed (see PRECAUTIONS: General).
- The safety of PROTOPIC Ointment has not been established beyond one year of non-continuous use.

(See boxed **Warning**, **Indications And Usage**, and **Dosage And Administration**).

PRECAUTIONS General

General
The use of PROTOPIC Ointment should be avoided on premalignant and malignant skin conditions. Some malignant skin
conditions, such as cutaneous T-cell lymphoma (CTCL), may
mimic atopic dermatitis.

The use of PROTOPIC Ointment in patients with Netherton's
Syndrome or other skin diseases where there is the potential for

Syndrome or other skin diseases where there is the potential for increased systemic absorption of tacrolimus is not recommended. The safety of PROTOPIC Ointment has not been established in patients with generalized erythroderma. The use of PROTOPIC Ointment may cause local symptoms such as skin burning (burning sensation, stinging, soreness) or puruflus. Localized symptoms are most common during the first few days of PROTOPIC Ointment application and typically improve as the lesions of atopic dermatitis resolve. With PROTOPIC Ointment 1014, 90% of the skin burning events had a duration between 2 minutes and 3 hours (median 15 minutes). 90% of the northing to the provinces of th

between 2 minutes and 3 hours (median 15 minutes). 90% of the pruritus events had a duration between 3 minutes and 10 hours (median 20 minutes), see ADVERSE REACTIONS).

Bacterial and Viral Skin Infections
Before commencing treatment with PROTOPIC Ointment, cutaneous bacterial or viral infections at treatment sites should be resolved. Studies have not evaluated the safety and efficacy of PROTOPIC Ointment in the treatment of clinically infected atomic dermatilis.

While patients with atopic dermatitis are predisposed to superficia skin infections including ezema herpeticum (Kaposi's varicelliform eruption), treatment with PROTOPIC Onthrent may be independently associated with an increased risk of varicella zoster virus infection (chicken pox or shingles), herpes simplex virus infection, or ezema herpeticum.

Virus infection, or ezerna nerpeucum.

Patients with Lymphadenopathy
In clinical studies, 112/13494 (0.8%) cases of lymphadenopathy
were reported and were usually related to infections (particularly
of the skin) and noted to resolve upon appropriate antibiotic
therapy. Of these 112 cases, the majority had either a clear etiology
or were known to resolve. Transplant platients receiving
immunosuppressive redimens (e.g., systemic tacrolimus) are at

increased risk for developing lymphoma; therefore, patients who receive PROTOPIC Ointment and who develop lymphadenopathy should have the etiology of their lymphadenopathy investigated. In the absence of a clear etiology for the lymphadenopathy, or in the presence of acute infectious mononucleosis, PROTOPIC Ointment should be discontinued. Patients who develop lymphadenopathy should be monitored to ensure that the lymphadenopathy resolves.

Sun Exposure

During the course of treatment, patients should minimi During the course of treatment, patients should minimize or avoid natural or artificial sunlight exposure, even while PROTOPIC is not on the skin. It is not known whether PROTOPIC Ointment interferes with skin response to ultraviolet damage.

Immunocompromised Patients

The safety and efficacy of PROTOPIC Ointment in immunocompromised patients have not been studied.

Renal Insufficiency
Rare post-marketing cases of acute renal failure have been reported in patients treated with PROTOPIC Ointment. Systemic absorption is more likely to occur in patients with epidermal barrier defects especially when PROTOPIC is applied to large body surface areas. Caution should also be exercised in patients predisposed to renal impairment.

Information for Patients
(See Medication Guide)
Patients using PROTOPIC Ointment should receive and understand the information in the Medication Guide. Please refer to the Medication Guide for providing instruction and information in the natient.

to the patient. What is the most important information patients should know about PROTOPIC Dintment?

The safety of using PROTOPIC Dintment for a long period of time is not known. A very small number of people who have used PROTOPIC Dintment have had cancer (for example, skin or lymphoma). However, a link with PROTOPIC Dintment has not been shown. Because of this concern, instruct patients:

Do not use PROTOPIC Dintment continuously for a long time.

Alse PROTOPIC Dintment of your green of skin but have express.

- Use PROTOPIC Ointment only on areas of skin that have eczema.
- Do not use PROTOPIC Ointment on a child under 2 years old.

Do not use PROTOPIC Unitment on a Child under 2 years old.
 PROTOPIC Clintment comes in two strengths:
 Only PROTOPIC Ointment 0.03% is for use on children aged 2 to 15 years.
 Either PROTOPIC Ointment 0.03% or 0.1% can be used by adults and children 16 years and older.
 Advise patients to talk to their prescriber for more information.
 How should PROTOPIC Ointment be used?
 Advise patients to:

- Use PROTOPIC Ointment exactly as prescribed.
- Use PROTOPIC Ointment only on areas of skin that have eczema.
- Use PROTOPIC Ointment for short periods, and if needed, treatment may be repeated with breaks in between.
- Stop PROTOPIC Ointment when the signs and symptoms of eczema, such as itching, rash, and redness go away, or as directed.
- Follow their doctor's advice if symptoms of eczema return after treatment with PROTOPIC Ointment.
- Call their doctor if: Their symptoms get worse with PROTOPIC Ointment.
- They get an infection on their skin
- Their symptoms do not improve after 6 weeks of treatment. Sometimes other skin diseases can look like eczema.

To apply PROTOPIC Ointment:

- Wash their hands before applying PROTOPIC.

- Wasn their natios eigher applying PRU LUPIC.
 Apply a thin layer of PROTOPIC Dintment twice daily to the areas of skin affected by eczema.
 Use the smallest amount of PROTOPIC Dintment needed to control the signs and symptoms of eczema.
 If they are a caregiver applying PROTOPIC Dintment to a patient, or if they are a patient who is not treating their hands, wash their hands with soap and water after applying PROTOPIC. This should remove any ointment lett on the hands.

 Do not hather shower or swim picht after applying PROTOPIC.
- Do not bathe, shower, or swim right after applying PROTOPIC. This could wash off the ointment.
- Into coulor wash on the official minimum. Make sure they check with their doctor first about the products that are right for them. Because the skin of patients with eczema can be very dry, it is important to keep up good skin care practices, If they use moisturizers, apply them after PROTOPIC Ointment.

What should patients avoid while using PROTOPIC Ointment?

- Avise patients:

 Do not use ultraviolet light therapy, sun lamps, or tanning beds during treatment with PROTOPIC Ointment.
- using usanieru wan PROLOPIC Uniment.
 Limit sun exposure during treatment with PROTOPIC Ointment even when the medicine is not on their skin. If patients need to be outdoors after applying PROTOPIC Ointment, wear loose fitting clothing that protects the treated area from the sun. Doctors should advise what other types of protection from the sun natients should use
- Do not cover the skin being treated with bandages, dressings or wraps. Patients can wear normal clothing

they swallow PROTOPIC Ointment.

Drug Interactions
Formal topical drug interaction studies with PROTOPIC Ointment have not been conducted. Based on its extent of absorption, interactions of PROTOPIC Ointment with systemically administered drugs are unlikely to occur but cannot be ruled out. The concomitant administration of known CYPSA4 inhibitors in patients with widespread and/or erythrodermic disease should be done with caution. Some examples of such drugs are erythromycin, itaroonazole, keldconazole, fluconazole, calcium channel blockers and cimetidine.

Carcinogenesis, Mutagenesis, Impairment of Fertility No evidence of genotoxicity was seen in bacterial (Salmonella as Lool) or mammalian (Chinese hamster lung-derived cells) witro assays of mutagenicity, the in vitro CHO/HGPRT as of mutagenicity, or in vivo clastogenicity assays performed mice. Earolimus did not cause unscheduled DNA synthesis

Reproductive toxicology studies were not performed with topical tacrolimus.

e are no adequate and well-controlled studies of topically instered tacrolimus in pregnant women. The experience with FOPIC Ointment when used by pregnant women is too limited rmit assessment of the safety of its use during pregnancy. to permit assessment of the satety of its use during pregnancy. There are no adequate and well-controlled studies of systemically administered tacrolimus in pregnant women. Tacrolimus is transferred across the placenta. The use of systemically administered tacrolimus during pregnancy has been associated with neonatal hyperkalemia and renal dysfunction. PROTOPIC Oitment should be used during pregnancy only if the potential benefit to the mother justifies a potential risk to the fetus.

benefit to the mother justifies a potential risk to the fetus. **Mursing Mothers**Although systemic absorption of tacrolimus following topical applications of PROTOPIC Ointment is minimal relative to systemic administration, it is known that facrolimus is excreted in human milk. Because of the potential for serious adverse reactions in nursing infants from tacrolimus, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. **Productive Uses**

Pediatric Use IC Ointment is not indicated for children less

Only the lower concentration, 0.03%, of PROTOPIC Ointment is recommended for use as a second-line therapy for short-term and non-continuous chronic treatment of moderate to severe atopic dermatitis in non-immunocompromised children 2 to 15 years of age who have failed to respond adequately to other topical prescription treatments for atopic dermatitis, or when those treatments are not advisable.

The long-term safety and effects of page 1.0000.

The long-term safety and effects of PROTOPIC Ointment

The long-term safety and effects of PRUTUPIC UNITARIES on the developing immune system are unknown (see boxed WARNING, WARNINGS and INDICATIONS AND USAGE).

The most common adverse events associated with PROTOPIC Ointment application in pediatric patients were skin burning and pruritus (see ADVERSE REACTIONS). In addition to skin burning and pruritus, the less common events (< 5%) of varicella solutions and west of the property of the propert pruritus (see ADVERSE REACTIONS). In addition to "skin burning and pruritus, the less common events (< 5%) of varicella zoster (mostly chicken pox), and vesiculobullous rash were more frequent in patients treated with PROTOPIC Ointment 0.03% compared to vehicle. In the open-label safety studies, the incidence of adverse events, including infections, did not increase with increased duration of study drug exposure or amount of ointment used. In about 4,400 pediatric patients treated with PROTOPIC Ointment, 24 (0.5%) were reported with eczema herpeticum. Since the safety and efficacy of PROTOPIC Ointment have not been established in pediatric patients below 2 years of age, its use in this age group is not recommended. Geriatric Use

age, its use in tills age group ...

Geriatric Use
Frour hundred and four (404) patients ≥ 65 years old received
PROTOPIC Ointment in phase 3 studies. The adverse event profile
for these patients was consistent with that for other adult patients.

AUVERSE REACTIONS

No phototoxicity and no photoallergenicity were detected in clinical studies with 12 and 216 normal volunteers, respectively. One out of 198 normal volunteers showed evidence of sensitization in a contact sensitization study.

The following table depicts the adjusted incidence of adverse events pooled across the 3 identically designed 12-week controlled studies for patients in vehicle, PROTOPIC Ointment 0.03%, and PROTOPIC Ointment 0.1% treatment groups. The table also depicts the unadjusted incidence of adverse events in four safety studies, regardless of relationship to the defense of the processing the proc
